INTRODUCTION

In recent years there has been increasing use of automated long duration precipitation gauges in Canada, especially in remote or relatively inaccessible areas and in specifiec research studies. This publication is designed to bring together these data and to make them available to potential users in convenient form.

It is recognized that this publication does not as yet include all long duration precipitation data being observed in Canada. However, the scope of this publication is expanding. In this connection, organizations collecting this king od precipitation data on a continuing basis, who are interested in having their data disseminated, are invited to contact the Atmospheric Environment Service, 4905 Dufferin Street, Downsview, Ontario M3H 5T4.

Table 1 - Long Duration Recording Precipitation Gauge Stations

Table 2 - Daily Precipitation - Digital Recording Gauges

Table 3 - Maximum Amounts - Digital Recording Gauges

Table 4 - Daily Precipitation - Non-Standard Recording Gauges

Table 5 - Maximum Amounts - Non-Standard Recording Gauges

Table 6 - Summary of the Storage Gauge Records

EXPLANATION OF TABLES

TABLE 1 - All the station who precipitation data are given in Tables 2 to 5, are listed in this table. Unless otherwise noted in Table 1, all gauges are equipped with Alter shields and the orifices are located at standard heights above the ground (2.5 m for the Fischer & Porter; 170 cm for the leupoid & Stevens; and 90 cm for the Universal Weighing). For further inforamtion concerning the locations of these station please refer to Table 1.

Table 2 - This table is computer produced and contains daily and monthly precipitation values expressed as 2.5 mm of water as recorded by Fischer & Porter automatic recording precipitation gauges. When using these values it should be noted that Fischer & Porter gauges record only to the nearest 2.5 mm and an error of ±2.5 mm is possible in any of the precipitation values recorded by this gauge*. If the time when precipitation fell cannot be established to within one day, the time is indicated as being uncertain by placing a number sign (#) beside the monthly total. If only the total precipitation is available (no time distribution) then "L's" are subsituted for daily totals throughout the period concerned. The first day following this period of "L's" will contain the accumulated amount of precipitation for the period. An asterisk (*) inserted between the station name and the first day of the month, indicates that precipitation data has been carried over from the previous month. This normally occurs when the end of a month is in the middle of a string of "L's".

* The error values quoted represent the limits in the sensitivities of the gauges. They should not be interpreted as referring to the absolute accuracies of the gauges.

INTRODUCTION

Depuis quelques années, on utilise de plus en plus au Canada les pluviomètres automatiques pour longue durée, spécialement dans les régions éloignées ou relativement inaccessibles et pour des recherches particulières. La présente publication réunit les données ainsi recueillies et les met à la dispositon des intéressés sous une forme commode.

La présente publication ne contient pas encoure toutes les données sur les précipitations relevées sur une longue durée au Canada, mais leur nombre augmente sans casse. A cet égard, les organismes qui recueillent régulièrement des données de te genre sur les précipitations et qui désirent les voir diffusées sont priés de communiquer avec le Service de l'Environnement atmosphérique au 4905 de la Dufferin, Downsview (Ontario) M3H 5T4.

Tableau 2 - Précipitations quotidiennes (digitaux)

Tableau 3 - Précipitations maximales (digitaux)

Tableau 4 - Précipitations quotidiennes (autres pluviographes non-standard)

Tableau 5 - Précipitations maximales (autres pluviographes non-standard)

Tableau 6 - Sommaire des données des pluviomètres à emagasinage

EXPLICATION DES TABLEAUX

TABLEAUX 1 - Ces tableau donne la liste de toutes les stations dont les données ont servi à préparer les tableaux 2 à 5. Sauf indication contraire au tableau 1, tous les pluviomètres sont munis d'un écran Alter et leur orifice est situé à une hauteur standard (2.5 m au-dessus du sol pour les pluviographs Fischer & Porter, 170 cm pour les pluviographes Leupold & Stevens et 90 cm pour les pluviographes Universal Weighing). Pour de plus amples renseignements sur l'emplacement des stations, consulter le tableau 1.

Tableau 2 - Ce tableau conient les valeurs quotidiennes de précipitation en millimetres, enregistrées par les pluviographes Fischer & Porter. Il est à remarquer, en utilisant ces valeurs, que le pluviographe Fischer & Porter n'enregistre à 2.5 mm près et qu'une erreur le ±2.5 mm par excès ou par défaut peut se retrouver dans toutes les valeurs de précipitation enregistrées par cet appareil*. Si l'on ne peut établir au jour près les moment de la précipitation, on en indique l'incertitude en faisant suivre le total mensuel du signe (#). Si possède que le chiffre de la précipitation toale, c'est-à-dire en l'absence de données quotidienne, il faut inscirire la lettre "L" s'inscrira au premier jour suivant ladite période. Pour indiquer cette accumulation, lorsqu'elle chevauche sur deux mois, on inscrit une astérisque (*) entre le nom de la station et le premier jour du mois suivant. Cela se produit normalement lorsque le dernier jour d'un mois donné tombe au milieu d'une série de "L".

* Les erreurs citées représentent les limites de sensibilité des pluviographes et non pas la précision absolue des appareils.

If missing data occurs during any portion of any day of the month, then an "M" replaces the daily total and the monthly total is left blank.

TABLE 3 - This table is computer produced and contains the greatest precipitation amounts recorded in each month for selected durations from 30 minutes to 24 hours. These amounts are derived from precipitation measurements made by the Fischer & Porter automatic precipitation gauge. The total hours of the gauges' monthly operation are indicated in the last column of this table. It should be noted that the Fischer & Porter gauge records only to the nearest 2.5 mm and an error of ± 2.5 mm is possible in any of the precipitation values recorded by this gauge*.

TABLE 4 - This table contains daily precipitation values expressed in 0.2 mm of water as recorded by Leupold & Stevens and Universal Weighing gauges. Due to the scale of the charts used by the above gauges, any of the precipitation values recorded have a possible error of up to ±0.2mm*.

Missing data for any portion of a calendar day will be indicated by an "M" in the appropriate column. This will result in an "M" being placed in the monthly total column as well.

Occasionally, daily totals of precipitation cannot be abstracted from precipitation gauge charts. The letter "L" is subsititued for the dialy total to indicate than precipitation was accumulated over this period. The first figure following one or more "L"'s is the amount of precipitation accumulated over the period. If a period of accumulated precipitation accumulated extends from one month into the next then the first month's total is left blank and an "X" is placed between the station name and the first day of the following month, indicating carried over precipitation data.

TABLE 5 - This table gives the heaviest precipitations recorded each month and expressed in 0.2 mm of water, for selected durations from 30 minutes to 24 hours. Precipitation intensities for the Leupold & Stevens gauge have been provided for durations of 60 minutes to 24 hours. Both the Leupold & Stevens and Universal Weighing gauges may have a possible error of ±0.2 mm due to the scale of the charts used*.

TABLE 6 - The precipitation values in this table represent the total precipitation accumulated in the indicated periods. This data is obtained primarily from Sacramento type storage gauges which are normally situated in remote areas and may be read at irregular intervals.

* The error values quoted represent the limits in the sensitivities of the gauges. They should not be interpreted as referring to the absolute accuracies of the gauges.

DESCRIPTION OF PRECIPITATION GAUGES

FISCHER & PORTER RECORDING GAUGE - The Fischer & Porter automatic long duration recording precipitation gauge collects all forms of precipitation and records their total weight on punched paper tape. The orifice of the gauge is 20.3 cm in diameter and normally is 2.5 m above ground, although it may be higher in areas where large snow depths occur. Unless otherwise noted in Table 1, all gauges are equipped with Alter shields to reduce wind effects while measuring snowfalls.

The gauge has a capacity of 50.5 mm of water equivalent which is recorded to the nearest 2.5 mm on punched tape. An electronic timer controls the period of time between each punchout.

En cas de donnée manquante pour un jour, on inscrit la lettre "M" à l'espace prévu pour ce jour et on laisse en blanc l'espace prévu pour l'inscription du total du mois.

TABLEAU 3 - Ce talbeau, obtenu par ordinateur, indique les plus fortes récipitations enregistrées chaque mois durant des intervalles de temps choists allant de 30 minutes à 24 heures. Ces valeurs proviennent de mesures faites par les pluviographes automatiques Fischer & Porter. La derniéer clolnne du tableau 3 indique le total des heures de fonctionnment pour le mois. II est à remarquer que le pluviographe Fischer & Porter n'enregistre à 2.5 mm près et qu'une erreur de ± 2.5 mm peut se retrover dans toutes les valeurs de précipitation enregistrées par cet appareil*.

TABLEAU 4 - Ce tableau donne les hauteurs quotidiennes de précipitation enregistreées à 0.2 mm près par les pluviographes Leupold & Stevens et Universal Weighing. Vu l'échelle des diagrammes utilisés, toute hauteur de précipitations peut comporter une erreur maximale de ±0.2 mm*.

La lettre "M" dans la colonne appropriée indique l'absence de données pour toute partie d'un jour quelconque. Dans ce cas, la lettre "M" se trouve également inscrite dans la colonne du total mensuel.

II arrive qu'il soit impossible d'obtenir une hauteur totale quotidienne de précipitation à partir des diagrammes des pluviographes. La lettre "L" remplce alors la hauteur totale quotidienne manquante et indique qu'on a une valeur cummulative pour cette période. La première valeur à la suite d'un ou de plusieurs "L" représente la hauteur cumulative des précipitations pour cette période. Le première valeur à la suite d'un ou de plusieurs "L" représente la hauteur cumulative des précipitations pour la période. Lorsqu'une telle période s'étend sur plus d'un mois, l'espace éspace réservé au total du premier mois reste en blance et un carré "A" figure entre le nom de la station et le premier jour du mois suivant pour indiquer que les hauteurs de précipitation du mois précédent sont reportées.

TABLEAU 5 - Ce tableau donne les hauteurs des précipitations les plus fortes entregistrées chaque mois à 0.2 mm près, au cours d'intervalles de temps choisis allant de 30 minutes à 24 heures dans le cas des pluviographes Universal Weighing et de 60 minutes à 24 heures dans le cas des pluviographes Leupold & Stevens. Les données recueillies par ces deux pluviographes peuvent comporter une erreur de ±0.2 mm, à cause de l'échelle des diagrammes utillisés*.

TABLEAU 6 - Ce tableau donne les hauteurs totales de précipitation accumulées au cours des périodes mentionnées, obtenues surtout à partir des pluviomètres Sacramento à emmasinage placés dans des endroits isolés où les relevés se font irrégulièrement.

* Les erreurs citées représentent les limites de sensibilité des pluviographes et non pas la précision absolue des appareils.

DESCRIPTION DES PLUVIOMÈTRES

PLUVIOGRAPE FISCHER & PORTER - Le pluviographe Fischer & Porter pour longue durée recueille toute forme de précipitation et en enregistre le poids total sur bande de papier perforée. L'oriffice du pluviographe mesure 20.3 cm de diamètre et se trouve normalement à 2.5 m au-dessus du sol. II est toute-fois possible de le placer plus haut dans les endroits où la couverture de neige atteint de grandes épaisseurs. Sauf indication contraire au tableau 1, tous les pluviographes sont dotés d'un écran Alter qui réduit les effets du vent sur les mesures des chutes de neige.

Le pluviographe qui a une capacité de 50.5 mm d'équivalent en eau, entregistre les mesures à 2.5 mm près sur bande perforées. Une minuterie électronique contrôle l'intervalle de temps entre chaque perforation.

LEUPOLD & STEVENS RECORDING GAUGE - The Leupold & Stevens Q12M duration recording precipitation gauge collects all forms of precipitation and records their total weights on a paper chart rotating on a drum. The orifice of the gauge is 20.3 cm in diameter and normally is 170 cm above ground although it may be higher in areas where large snow depths occur. Unless otherwise noted in Table 1, all gauges are equipped with Alter shields to reduce wind effects while measuring snowfalls.

The gauge has a capacity of 610 mm of water equivalent and records on a chart which can be read to the nearest 0.2 mm. The clock, wound by a falling weight, rotates the chart and drum assembly once in 30 days giving a time resolution of the order of 2 hours.

UNIVERSAL RECORDING GAUGE - The Universal recording precipitation gauge collects all forms of precipitation and recprds their weight on a paper chart rotating on a drum. The orifice of the gauge is 20.3 cm is diameter and normally is 90 cm above ground.

The gauge has a capacity of 305 mm of water equivalent which is recorded on a chart with an accuracy of about 0.2 mm. A spring driven clock rotates the chart once every 6 hours to 7 days, depending on the gearing.

PRECIPITATION STORAGE GAUGES - The storage gauges most commonly used in Canada is the Sacramento type. This gauge has a 20.3 cm orifice and is cone shaped for its entire length, which is approximately 1.2 m. The gauge is mounted on a stand at a height which depends on the maximum expected snow depth.

The Standpipe storage gauge is currently in use in parts of western Canada and consists of plastic pipe 25.4 cm in diameter and normally 1.1 m in length. The pipe is mounted vertically and is held in this position by guy wires and a rigid base assembly. The capacity of this gauge is 1,118 mm if precipitation.

Both types of storage gauges are equipped with the Alter type wind shield which reduceds the wind effects on the measurement of snowfall. Antifreeze is put in the gauges during cold weather and all is added to prevent evaporation. Measurements of both gauges are made with a measuring ruler graduated in mm. Readings are taken at regular or irregular intervals depending upon the accessibility of the gauges' location.

ACKNOWLEDGEMENTS - We wish to acknowledge the cooperation of the following agencies for supplying data for this publication:

British Columbia Ministry of Transportation, communication and Highways

British Columbia Hydro and Power Authority

British Columbia Ministry of Environment

University of British Columbia

Province of Alberta

Eastern Rockies Conservation Board

University of Saskatchewan

Province of Manitoba

Ontario Ministry of the Environment

PLUVIOGRAPHE LEUPOLD & STEVENS - Le pluviographe Leupold & Stevens Q12M pour longue durée recueille toute forme de précipitations et en enregistre le poids total sur un cylindre tournant. L'orifice du pluviographe mesure 20.3 cm de diamètre et se trouve normalement à 170 cm au-dessus du sol. Toutefois, dan les endroits où la converture de neige atteint de grandes épaisseurs, il est pissible de le placer plus haut. Sauf indication contraire au tableau 1, tous le pluviographes sont dotés d'un écran Alter qui réduit les effets du vent sur les mesures des chutes de neige.

Le pluviographe, qui a une capacité de 610 mm d'équivalent en eau, entregistre les mesures sur une feuille diagramme à 0.2 mm près. Le mouvement d'horlogerie entraîné par une contrepoids fait faire au cylindre un tour complet en 30 jours ce qui permet une précision de temps de l'ordre de 2 heures.

PLUVIOGRAPHE UNIVERSAL - Le pluviographe Universal recueille toute forme de précipitations et en enregistre le poids sur une feuille diagramme montée sur un cylindre tournant. L'orifice de L'appareil mesure 20.3 cm de diamètre et se trouve normalement à 90 cm au-dessus du sol.

Le pluviographe, qui a une capacité de 305 mm d'équivalent en eau, enregistre les mesures sur une feuille diagramme avec une précision de l'ordre de 0.2 mm. Selon le rapport d'engrenage du mouvement d'horlogerie à ressort, il faut au cylindre de 6 heures à 7 jours pour faire un tour complet.

PLUVIOMÈTRES A EMMAGASINAGE - Le pluviomètre du type Sacramento est celui qui est le plus couramment utilisé au Canada. Cet appareil, de forme générale conique, muni d'un orifice de 20.3 cm mesure environ 1.2 m de long. On le fixe sur un support, à une hauteur qui dépend de l'épaisseur maximale de neige prévue.

D'usage courant dans certaines régions de l'ouest du Canada, le pluviomètre Standpipe est un tube de plastique de 25.4 cm de diamètre et, en principle, de 1111 m de longueur. Monté à la verticale, il est maintenu par des haubans et un socle fixe. Sa capacité est de 1,118 mm de précipitations.

Ces deux types de pluviomètres sont dotés d'un écran de protection contre le vent, de type Alter, qui réduit les effets du vent sur les mesures des chutes de neige. On utilise dans ces appareils de l'antigel par temps froid et de l'huile pour empêcher l'évaporation. La mesure des précipitations dans ces deux pluviomètres se fait à l'aide d'une règle graduée en mm. Les relevés se font à intervalles réguliers ou non, selon l'accessibilité de l'appareil.
